Summary

Introduction

The Movie Ticket Booking System is a Python-based application developed to automate and simplify the process of booking movie tickets. The system enables users to view available movies, select show timings, choose seats, and confirm bookings through an interactive interface. It is designed using fundamental programming concepts such as functions, modular structure, and file handling to ensure efficient data management and smooth operation.

The main objective of this project is to provide a user-friendly and reliable platform that simulates real-world ticket booking systems. It reduces manual effort and enhances accuracy in managing booking records. Additionally, the project demonstrates effective teamwork and version control using GitHub.

Overall, the system highlights the practical application of Python in developing scalable and efficient solutions for everyday problems.

Scope of the Project

- Allows booking tickets
- Does not include real payment gateway (simulation only)

Methodology

- Requirement analysis
- System design
- Coding using Python
- Testing and debugging
- Deployment via GitHub

References

- Python documentation
- YouTube tutorials
- GeeksForGeeks
